

Drawing using automatic borders

You can use auto borders when drawing a polygon. Using automatic borders allows you to automatically trace the outline of polygons existing in the annotation.

- To do this, go to settings -> workspace tab and enable `Automatic Bordering` or press `ctrl` while drawing a polygon.

- Start drawing / editing a polygon.
- Points of other shapes will be highlighted, which means that the polygon can be attached to them.
- Define the part of the polygon path that you want to repeat.

- Click on the first point of the contour part.

- Then click on any point located on part of the path. The selected point will be highlighted in purple.

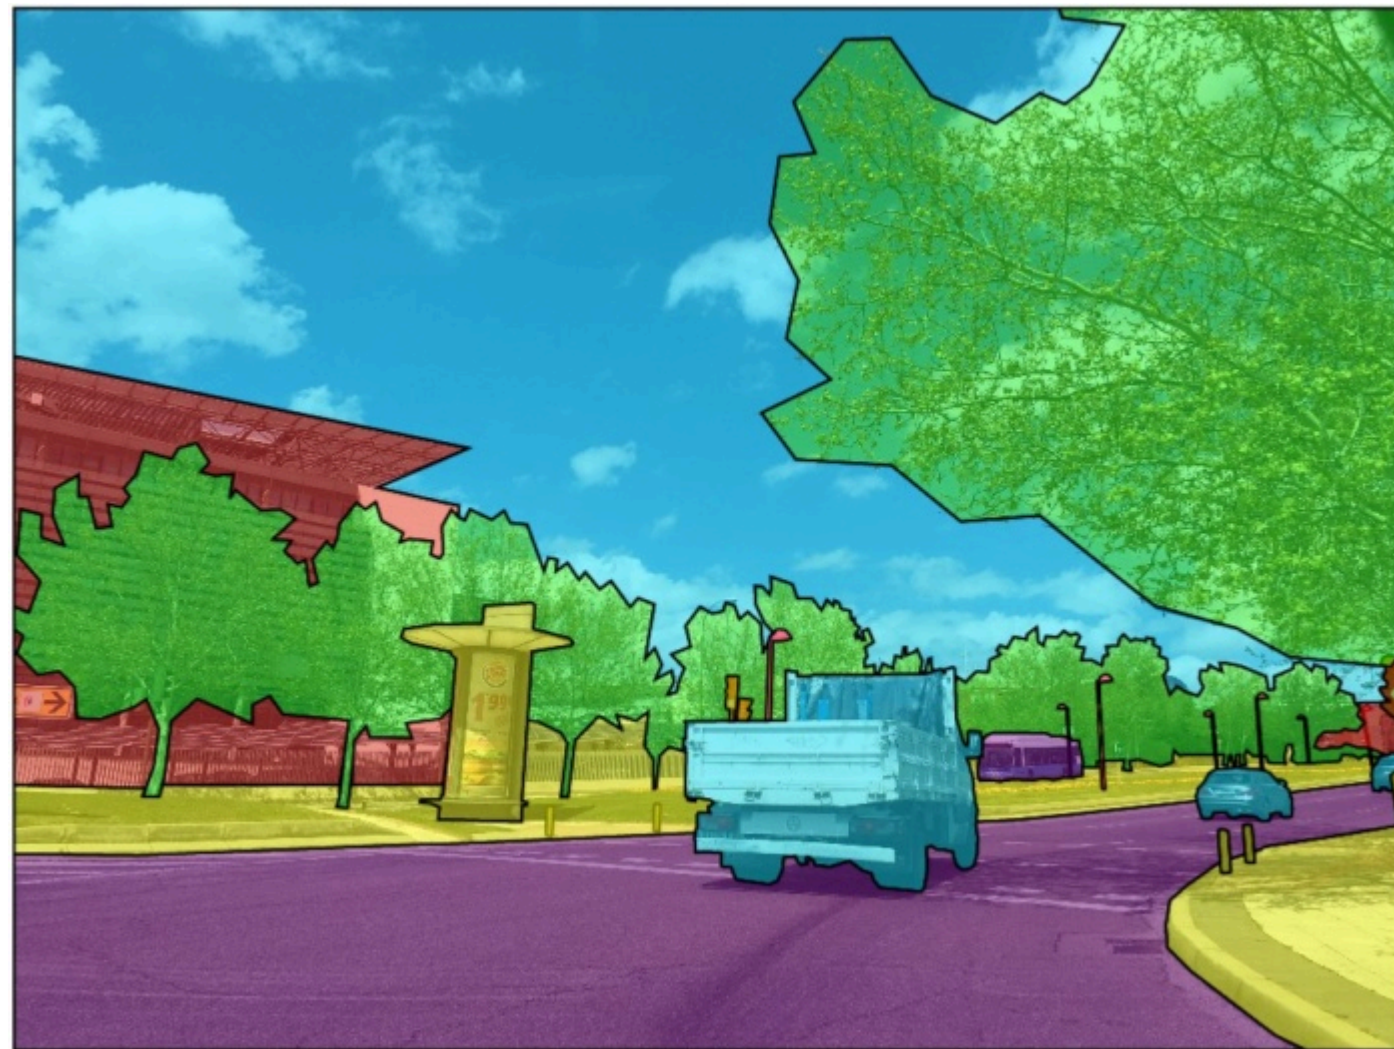

- Click on the last point and the outline to this point will be built automatically.

Besides, you can set a fixed number of points in the `Number of points` field, then drawing will be stopped automatically. To enable dragging you should right-click inside the polygon and choose `Switch pinned property`.

Below you can see results with opacity and black stroke:

If you need to annotate small objects, increase `Image Quality` to 95 in `Create task` dialog for your convenience.
