

Edit polygon

To edit a polygon you have to click on it while holding `Shift`, it will open the polygon editor.

- In the editor you can create new points or delete part of a polygon by closing the line on another point.
- When `Intelligent polygon cropping` option is activated in the settings, CVAT considers two criteria to decide which part of a polygon should be cut off during automatic editing.
 - The first criteria is a number of cut points.
 - The second criteria is a length of a cut curve.

If both criteria recommend to cut the same part, algorithm works automatically, and if not, a user has to make the decision. If you want to choose manually which part of a polygon should be cut off, disable `Intelligent polygon cropping` in the settings. In this case after closing the polygon, you can select the part of the polygon you want to leave.
